"Cloning of the human alpha 1d-adrenergic receptor and inducible expression of three human subtypes in SK-N-MC cells.";
Mol. Pharmacol. 47:977-986(1995).
-!-FUNCTION: THIS ALPHA-ADRENERGIC RECEPTOR MEDIATES ITS EFFECT THROUGH THE INPLUX OF EXTRACELLULAR CALCIUM.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                       SEQUENCE FROM N.A.

-!- FUNCTION: THIS ALPHA-ADRENBERGIC RECEPTOR MEDIATES ITS EFFECT
THROUGH THE INFLUX OF EXTRACELLULAR CALCIUM.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

Yu H., Schreiber S.L.;
"Structure of guainine-nucleotide-exchange factor human Mss4 and identification of guainine-nucleotide exchange surface.";
Nature 376:788-791(1995).
-!-FUNCTION: GUANINE-NUCLEOTIDE-RELEASING PROTEIN THAT ACTS ON MEMBERS OF THE SCE4/YPTI/RAB SUBFAMILY. STIMULATES GDP RELEASE FROM BOTH YPTI AND RABBA, BUT IS LESS ACTIVE ON THESE PROTEINS
THAN ON THE SEC4 PROTEIN. MIGHT PLAY A GENERAL ROLE IN VESICULAR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Genew, HGNC:9797; RABIF.

Submitted (FEB-1995) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Required for the retention of luminal endoplasmic reticulum proteins. Determines the specificity of the luminal ER protein refention system. Also required for normal vesicular traffic through the Golgi (By similarity).
-!- SUBCELLULAR LOCATION: Integral membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

"Molecular cloning, characterization and evolution of the genes
encoding a new group of short-chain alpha-neurotoxins in an Australian
elapid, Pseudonaja textilis.";
FEBS Lett. 473:303-310(2000).
-!- FUNCTION: Lethal neurotoxin, binds and inhibits nicotinic
acetylcholine receptors (nACAR) (By similarity).
-!- SUBCELULIAR LOCATION: Secreted (By similarity).
-!- TISSUE SPECIFICITY: Expressed by the venom gland (Probable).
-!- SIMILARITY: Belongs to the snake toxin family.
                                                                                                                                  8 LLMAGLALOPGTALLCYSCKAQVSNEDCLQVENCTQLGEQCWTARIRAVGLLTV-----
